HERE 'S HOW YOU CAN MAKE BETTER SOLDERED JOINTS
BY REDUCING OPERATOR FATIGUE

HATCHET TYPE IRONS

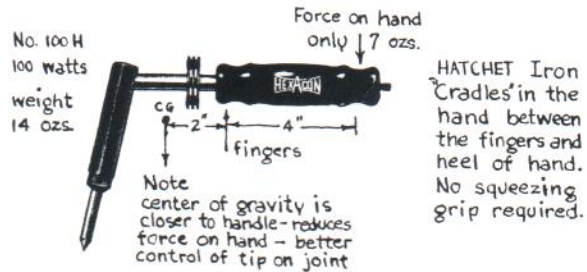

PERFECT BALANCE—LESS FATIGUE—BETTER SOLDERED JOINTS
FOR INACCESSIBLE PLACES

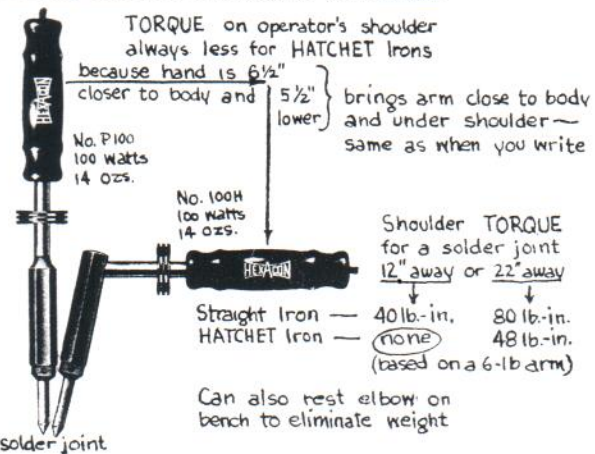

HEXAACON HATCHET IRONS are perfectly balanced in weight and enable the operator to solder in a more natural position, eliminating the "heavy hand" which causes poor soldered joints.

When the hand is tired the operator either does not hold the iron long enough on the joint or rests on the joint too long - either case resulting in a poor soldered joint.

The operator has to "choke" the conventional straight iron to hold it in his hand, whereas the HEXAACON HATCHET Iron rests in the hand with no perceptible grip whatsoever. This relieves hand strain.

Then, too, soldering is done in such a natural position that fatigue of operator's arm and back is reduced to a minimum.

FEATHERWEIGHT HATCHET IRON

So light its weight is hardly noticeable (5 1/2 ozs. less cord), but more powerful than the wattage rating indicates. Hatchet design makes iron effortless to use. No transformer or other cumbersome and expensive equipment required. At 60 Watts has successfully replaced irons up to 100 Watts in many instances.

Here's a simple test. Place your hand on your desk as if to write. Now, keeping your elbow bent, move away from the desk and let your arm rotate under your shoulder a little so that it is freely balanced. This is the way you use the HATCHET Iron.

Compare this with the position of your arm for lighting a friend's cigarette, which extends the arm away from your shoulder causing strain same as using a conventional straight iron.
